PIX-HARVESTER® BELTS

Introduction:

Harvester combines drives are subjected to the most strenuous operations, the dust, the soil, stone granules, stray remains of the harvested crops are likely to create interference during the operation. The drive is often subjected to extreme weather conditions such as hot sunny days, extreme winters and rainy season.

Nevertheless the drive also uses a small size idler which in turn puts a lot of pressure on the Belt resulting into unavoidable increase in temperature and may cause the Belt to deform & reduction in its life. All these factors calls for a very special construction for the Belts which are used in the harvester combines.

PIX which is already an established name in manufacturing of application specific Belts has developed Belts meant specially for the agricultural industry. PIX Harvester Belts are the result of its over three decades of research and experience in the field of mechanical power transmission where the Belts are subjected to stringent conditions. The Belts are made resistant to all the extremities encountered in the Harvester Combines.

Considering the huge and varied demand from equipment used in agriculture. PIX has developed a huge range of Belts covering the entire spectrum of Agricultural application from Harvester Combines to the tractors and the equipment used as an attachment to the combines or tractors.

PIX Harvester Combine Belts are designed to follow the international standard norms used by the original equipment manufacturers and are widely used in the replacement market and offers a trouble-free and zero-maintenance life.

PIX Harvester Belts are available in - Wrapped Construction, Moulded Raw Edge Cogged Construction, Ribbed / Poly V-Belts and Flat Belts.

PIX Harvester Belts are made up of -

- Superior tensile members with specially formulated rubber compound to withstand the rough and tough conditions encountered in Harvester Combines.
- They are resistant to shock loads, vibrations and high abrasion with very low elongation.
- They are antistatic and oil resistant.

The features list is exhaustive, the detailed features are listed ahead.

Preventive Maintenance Tips

Before proceeding for the maintenance of drive, switch the mains off. Check the pulley for rust or wear, clean it if required.

Drive should never be kept open, protect the drive with the help of a suitable drive guard.

Avoid dressing of belts, never do this under any circumstances.

Be alert all the times, look and listen for anything unwanted, correct it immediately.

Do not expose the belts to oil, spray, liquid, paste or hazardous chemicals, which are incompatible with the belt material.

Belts operating at elevated temperatures above 70°C, should be checked periodically. Use special heat resistant belts to avoid this problem.

Do not mix the belts of various brands, types, used & new ones.

Belt turn over is due to misalignment, worn out pulleys or excessive vibrations.

Squeal is a result of insufficient belt tension. If it continues even after re-tensioning, the drive should be examined for overload. Correct the design, if required.

The noise like chirping of birds occurs because of dust or dry bearings. Clean and lubricate the bearings regularly.

Always use installation allowance so the belts can easily be installed in the pulley grooves. Switch off the drive before changing the belts.

Never place the belt by applying force with the help of a screw driver or a lever. It may damage the fabric top cover, the cords may also break. A belt so fitted will turn over in the pulley.

Preventive Maintenance Tips

Presence of foreign material can result into excessive wear or breakage of belt.

Belt guard is a must to ensure safety and cleanliness. Screened meshed or grilled guards are the best for heat dissipation. Select a proper mesh size which will prevent the entry of human finger or any other object.

Check the belt for cracks at the bottom surface. Cracks can be avoided by using large-diameter and larger reverse bend idler pulleys.

Prevent the whipping of belts. Re-tension them or use belts from same manufacturer or avoid using new and used belts together.

Inspect pulley grooves. Worn out grooves provide allowance for the belts to slip, leading to a premature failure. Use PIX pulley gauges to check the pulley grooves.

Change in ride out/in indicates uneven belt wear or worn-out pulleys.

Do not allow belts to vibrate laterally.
